

ABSTRACT OF THE DISCLOSURE

A fire extinguisher (61) with a reservoir made from a plastic material (60), for containing an extinguishing agent and a discharge device (65), fixed to a neck (64) of the reservoir, for controlling a discharge of the extinguishing agent. The discharge device has an outlet nozzle (70) and a plunge tube (69), arranged within the reservoir (60), such as to conduct the extinguishing agent from a base section (71) of the reservoir, opposite the neck, to the outlet nozzle, characterised in that a wall (62) of the reservoir has an internal rib (3) with a helical form, the coil axis of which (A) is essentially parallel to the plunge tube (69).
